Title	A hardware-software co-design approach for embedded systems
Description	In this work, we propose a novel approach for designing embedded systems that integrates hardware and software components. The approach is based on a co-design methodology that allows for the simultaneous development of hardware and software components, leading to improved performance and reduced development time. We evaluate our approach through a case study on the design of an embedded system for a smart home application, demonstrating its effectiveness in terms of performance, energy efficiency, and ease of development.
Objectives	- Analyser l'état de l'art dans la thématique - Proposer une approche de co-design pour les systèmes embarqués: - En coordination avec les travaux de recherche - Dans le contexte de la filière ISC - Évaluer l'approche à travers une étude de cas sur un système de maison intelligente. - Comparer les résultats avec des approches traditionnelles de développement de systèmes embarqués
